**Subject:** San Jacinto Questions

David,

A few questions about the FS alternatives:

1. What is the estimated volume of soil in the Southern Impoundment that exceeds the PCL there?
2. What is the estimated volume in the upland sand area exceeding the PCL there?
3. For each of the alternatives on the northern impoundment, what is the average TEQDF,M under the cap or remaining part of the cap after implementation of each alternative?
4. What are the ecological hazard quotients and PCLs for benthic macro-invertebrates in sediment? Even though the area may be currently under the cap, PCLs are needed to show where area is and that it's all covered.
5. What is the estimated volume of sediment that exceeds the ecological PCL for sediment?

Please let me know if any questions/discussion on this.

Thanks,

Gary Miller
